

# Embedded Linux development with Buildroot training

On-site training, 3 days

Latest update: May 20, 2024

Title	Embedded Linux development with Buildroot training
<b>Training objectives</b>	<ul style="list-style-type: none"><li>• Be able to understand the role and principle of an embedded Linux build system, and compare Buildroot to other tools offering similar functionality.</li><li>• Be able to create a simple embedded Linux system with Buildroot: create a configuration, run the build, install the result on an embedded platform.</li><li>• Be able to adjust the Buildroot configuration to build an embedded Linux system tailored to specific needs: choice of the cross-compilation toolchain, management of the Linux kernel configuration, customization of the root filesystem contents, etc.</li><li>• Be able to create new packages in Buildroot to integrate additional applications and libraries into the embedded Linux system.</li><li>• Be able to use the tools offered by Buildroot to manage and analyze the build: security vulnerability tracking, license compliance, etc.</li><li>• Be able to develop and debug Linux user-space applications in the context of Buildroot.</li><li>• Be able to interact with the Buildroot open-source community, and to understand the internals of Buildroot.</li></ul>
<b>Duration</b>	<b>Three</b> days - 24 hours (8 hours per day)
<b>Pedagogics</b>	<ul style="list-style-type: none"><li>• Lectures delivered by the trainer: 40% of the duration</li><li>• Practical labs done by participants: 60% of the duration</li><li>• Electronic copies of presentations, lab instructions and data files. They are freely available at <a href="https://bootlin.com/doc/training/buildroot">https://bootlin.com/doc/training/buildroot</a>.</li></ul>
<b>Trainer</b>	One of the engineers listed on: <a href="https://bootlin.com/training/trainers/">https://bootlin.com/training/trainers/</a>
<b>Language</b>	Oral lectures: English, French. Materials: English.
<b>Audience</b>	Companies already using or interested in using Buildroot to build their embedded Linux systems.

Prerequisites	<ul style="list-style-type: none"><li>• <b>Knowledge and practice of UNIX or GNU/Linux commands:</b> participants must be familiar with the Linux command line. Participants lacking experience on this topic should get trained by themselves, for example with our freely available on-line slides at <a href="https://bootlin.com/blog/command-line/">bootlin.com/blog/command-line/</a>.</li><li>• <b>Minimal experience in embedded Linux development:</b> participants should have a minimal understanding of the architecture of embedded Linux systems: role of the Linux kernel vs. user-space, development of Linux user-space applications in C. Following Bootlin's <i>Embedded Linux</i> course at <a href="https://bootlin.com/training/embedded-linux/">bootlin.com/training/embedded-linux/</a> allows to fulfill this pre-requisite.</li><li>• <b>Minimal English language level: B1</b>, according to the <i>Common European Framework of References for Languages</i>, for our sessions in English. See <a href="https://bootlin.com/pub/training/cefr-grid.pdf">bootlin.com/pub/training/cefr-grid.pdf</a> for self-evaluation.</li></ul>
Required equipment	<ul style="list-style-type: none"><li>• Video projector</li><li>• One PC computer on each desk (for one or two persons) with at least 8 GB of RAM, and Ubuntu Linux 22.04 installed in a <b>free partition of at least 30 GB</b></li><li>• Distributions other than Ubuntu Linux 22.04 are not supported, and using Linux in a virtual machine is not supported.</li><li>• <b>Unfiltered and fast connection to Internet:</b> at least 50 Mbit/s of download bandwidth, and no filtering of web sites or protocols.</li><li>• <b>PC computers with valuable data must be backed up</b> before being used in our sessions.</li></ul>
Certificate	Only the participants who have attended all training sessions, and who have scored over 50% of correct answers at the final evaluation will receive a training certificate from Bootlin.
Disabilities	Participants with disabilities who have special needs are invited to contact us at <a href="mailto:training@bootlin.com">training@bootlin.com</a> to discuss adaptations to the training course.

## Hardware platform for practical labs, option #1

### BeagleBone Black board

- An ARM AM335x (single Cortex-A8) processor from Texas Instruments
- USB powered
- 512 MB of RAM
- 2 or 4 GB of on-board eMMC storage
- USB host and device
- HDMI output
- 2 x 46 pins headers, to access UARTs, SPI buses, I2C buses and more.

## Hardware platform for practical labs, option #2

### STMicroelectronics STM32MP157D Discovery Kit 1 board

- STM32MP157D (dual Cortex-A7) processor from STMicroelectronics
- USB powered
- 512 MB DDR3L RAM
- Gigabit Ethernet port
- 4 USB 2.0 host ports
- 1 USB-C OTG port
- 1 Micro SD slot
- On-board ST-LINK/V2-1 debugger
- Arduino compatible headers
- Audio codec, buttons, LEDs

## Day 1 - Morning

### Lecture - Embedded Linux and build system introduction

- The general architecture of an embedded Linux system
- Build systems vs. binary distributions
- Role of a build system
- Comparison of existing build systems

### Lecture - Introduction to Buildroot

- Key facts about the project
- Getting Buildroot
- Basic configuration of Buildroot
- Doing a first build

### Lab - Basic Buildroot usage

- Getting and setting up Buildroot
- Configuring and building a basic system with Buildroot for an embedded platform
- Flash and test the generated system on the embedded platform

### Lecture - Managing the build and configuration

- Out of tree build
- Using and creating *defconfigs*
- Defconfig fragments
- Other building tips

## Day 1 - Afternoon

### Lecture - Buildroot source and build trees

- Details about the Buildroot source code organization
- Details about the Buildroot build tree

### Lecture - Toolchains in Buildroot

- The different choices for using toolchains in Buildroot
- Overview of the toolchain options
- Using existing binary toolchains, such as Bootlin toolchains, understanding *multilib* capabilities and integration of toolchains in Buildroot
- Generating custom toolchains with *Crosstool-NG*, and re-use them as external toolchains

### Lecture - Managing the Linux kernel configuration

- Loading, changing and saving the kernel configuration

### Lecture - Root filesystem construction in Buildroot

- Understand how Buildroot builds the root filesystem: *skeleton*, installation of packages, overlays, *post-build* and *post-image* scripts.
- Customization of the root filesystem contents
- System configuration: *console* selection, various */dev* management methods, the different *init* implementations, etc.
- Understand how Buildroot generates filesystem images

### Lab - Root filesystem customization

- Explore the build output
- Customize the root filesystem using a *rootfs overlay*
- Customize the kernel with patches and additional configuration options
- Add more packages
- Use *defconfig* files and *out of tree* build

## Day 2 - Morning

### Lecture - Download infrastructure in Buildroot

- Downloading logic
- Primary site and backup site, doing offline builds
- VCS download, integrity checking
- Download-related *make* targets

### Lecture - GNU Make 101

- Basics of make rules
- Defining and referencing variables
- Conditions, functions
- Writing recipes

### Lecture - Integrating new packages in Buildroot

- How to integrate new packages in the Buildroot configuration system
- Understand the different package infrastructures: for *generic*, *autotools*, *CMake*, *Python* packages and more.
- Writing a package `Config.in` file: how to express dependencies on other packages, on toolchain options, etc.
- Details on writing a package recipe: describing the package source code location, download method, configuration, build and installation steps, handling dependencies, etc.

### Lab - New packages in Buildroot

- Create a new package for *nInvaders*
- Understand how to add dependencies
- Add patches to *nInvaders* for *Nunchuk* support

## Day 2 - Afternoon

### Lecture - Advanced package aspects

- Licensing report
- Patching support: patch ordering and format, global patch directory, etc.
- User, permission, device tables
- Init scripts and systemd unit files
- Config scripts
- Understanding *hooks*
- Overriding commands
- Legacy handling
- Virtual packages

### Lab - Advanced packages

- Package an application with a mandatory dependency and an optional dependency
- Package a library, hosted on GitHub
- Use *hooks* to tweak packages
- Add a patch to a package

## Day 3 - Morning

---

### Lecture - Analyzing the build: licensing, dependencies, build time

- Usage of the legal information infrastructure
- Graphing dependencies of packages
- Collecting and graphing build time information

### Lecture - Advanced topics

- BR2\_EXTERNAL to store customizations outside of the Buildroot sources
- Package-specific targets
- Understanding rebuilds
- Tips for building faster

### Lab - Advanced aspects

- Use build time graphing capabilities
- Use dependency graphing capabilities
- Use licensing report generation, and add licensing information to your own packages
- Use BR2\_EXTERNAL

## Day 3 - Afternoon

---

### Lecture - Application development with Buildroot

- Using Buildroot during application development
- Usage of the Buildroot environment to build applications outside of Buildroot
- Generate an SDK for other developers
- Remote debugging with Buildroot

### Lab - Application development with Buildroot

- Build and run your own application
- Remote debug your application
- Use <pkg>\_OVERRIDE\_SRCDIR

### Lecture - Understanding Buildroot internals

- Detailed description of the Buildroot build process: toolchain, packages, root filesystem construction, stamp files, etc.
- Understanding virtual packages.

### Lecture - Getting support and contributing

- Getting support: *Bugzilla*, *mailing list*, *IRC*
- Contributing: understanding the development process, how to submit patches
